Applied Data Science Capstone
Battle of the Vancouver Neighbourhoods
Author: Marijn Heuts

Introduction

This document is the introduction to the capstone project for the Applied Data Science course. This project aims to explore the different neighbourhoods of Vancouver, so when people want to move there, they have a better understanding of the differences between those neighbourhoods.

During this research, we will compare the different neighbourhoods to each other on the various venues that are available, the most spoken foreign languages, and the crime rate.

This report aims to give new immigrants to Vancouver a better understanding of the city's different districts and for the city to see how they can market the different districts of the city.
